derived from ORESTES PCR (U.S. Letters Patent application
No. 196,716 - Ludwig Institute for Cancer Research)
profiles into the pUC 18 vector. Reverse transcription of
tissue mRNA and cDNA amplification were performed under
low stringency conditions.

Minimum DB seq length: 0
Maximum DB seq length: 200000000

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Treating glomerulonephritis with antibody against complement C5 component - to inhibit complement induced cell lysis Claim 38; Page 123-125; 181pp; English.  A DNA construct (T08483) codes for a humanised CDR-grafted and framework sequence-altered Fd 5G1.1 VH + IGHRL (R77610), which includes CDRs derived from mouse anti-C5 monoclonal antibody 5G1.1.  The DNA can be subcloned together with DNA (T08484) coding for a humanised light chain (R77612) into vector APEX-3P (T08476) for expression of humanised antibody in human 293 EBNA cells. Such recombinant antibodies retain the ability of MAb 5G1.1 to block human complement C5a generation and thus to reduce glomerular glomerulonephritis.                                                                                                                                                                                                                                                                                                                                                                    9
            component - to inhibit complement induced cell lysis claim 37; Pages. 135-137; 181pp; English.

A DNA construct (108487) codes for a humanised CDR-grafted
light chain, designated 5G1.0 V + IGHRLD (R77615), which includes
CDRs derived from mouse anti-C5 monoclonal antibody 5G1.1. The
DNA can be subcloned together with DNA (T08484) coding
for a humanised R(R77611) into vector APBX-3P (T08476) for
expression of humanised antibody in human 293 EBNA cells. Such
recombinant antibodies retain the ability of MAb 5G1.1 to block
human complement C5a generation and thus to reduce glomerular
inflammation and kidney dysfunction associated with
                                                                                                                                                                                                                                                                                                                                    GGGGCACAGCGGCCTGGCTGCCTGGTCAAGGACTACTTCCCCGAACCGGTGACGGTG

CA DNA construct (T08483) codes for a humanised CDR-grafted and C framework sequence-altered Fd SG1.1 VH + IGHRL (R77610), which includes CDRs derived from mouse anti-C5 monoclonal antibody 5G1.1.

CThe DNA can be subcloned together with DNA (T08484) coding for a humanised light chain (R77612) into vector APEX-3P (T08476) for expression of humanised antibody in human 293 EBNA cells. Such C expression of humanised antibody in human 293 EBNA cells. Such crecombinant antibodies retain the ability of MAD 5G1.1 to block human complement C5a generation and thus to reduce glomerular inflammation and kidney dysfunction associated with Sc Johnson complement Say generation and thus to reduce glomerular C glomerulonephritis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    밁
Treating glomerulonephritis with antibody against complement C5 component to inhibit complement induced cell lysis Claim 26; Page 116-119; 181p9; English.

A DNA construct (708481) codes for chimeric light chain 5G1.1M1 VL HuK (R77608), which can form the light chain portion of an Fab.

The chimeric light chain includes CDRs derived from mouse anti-C5 monoclonal antibody 5G1.1. The DNA can be subcloned with DNA (708482) coding for chimeric Fd (R77609) into vector APEX-3P (T08476) for prodn. of chimeric Fab in human 293 EBNA cells. Such recombinant antibodies retain the ability of MAb 5G1.1 to block human complement C5a generation and thus to reduce glomerular inflammation and kidney dysfunction associated with glomerulonephritis.

PS Example P; fig 48A-Z; 328pp; English.

CC encoding a humanised 664VIN35A IgG (see W69316) containing complementarity determining regions of murine anti-interleukin-8 CC (IL-8) monoclonal antibody (MAD) 665.2.5 (see W69309-10) in a CC human template. The plasmid has a pSVI backbone. Humanised CC anti-IL-8 MADs (see W69301-04) are described for use in diagnostic capplications and in the treatment of inflammatory disorders. The CC applications and in the treatment of inflammatory disorders. The CC dischemic reperfusion, adult responses associated with inflammatory to swel disease (such as Crohn's disease and ulcerative colitis), cc dischemic reperfusion, adult respiratory distress syndrome, vasculitis, meningitis, encephalitis, uveitis, autoimmune diseases such as rheumatoid arthritis, Sjorgen's syndrome, vasculitis, capticaemia or trauma, alcoholic hepatitis, bacterial pneumonia, cc chronic bronchitis, bronchiectasis, and cystic fibrosis.

New antibodies and proteins bind conserved epitope of Fas antigen used to evaluate drugs in animal models and to treat Fas-associated diseases e.g. autoimmune disease, allergy, atopy, arteriosclerosis, myocarditis, hepatitis and AlDS Claim 27; Page 210-212; 292pp; English.

Fig. myocarditis, hepatitis and AlDS Claim 27; Page 210-212; 292pp; English.

This nucleotide sequence codes for the VD type humanised heavy claim (see W83036) of murine anti-human Fas monoclonal antibody HFE7A. It was constructed from DNA fragments obtained by PCR CC Chain (see W83036) of murine anti-human Fas monoclonal antibody HFE7A. It was constructed from DNA fragments obtained by PCR CC Chain (see W83036) of murine anomonic DNA. Host coll Escherichia coli pgHSL7A62 SANK 73397 harbors plasmid pgHSL7A62 carrying a fusion fragment of the humanised VPF HFE7A have coll Escherichia coli pgHSL7A62 SANK 73397 harbors plasmid pgHSL7A62 carrying a fusion cording humanised antibodies by culturing host cells. Humanised versions of HFE7A (see W83031-37), like native HFE7A, are capable of inducing apoptosis in normal cells expressing Fas, and of colinguals apoptosis in normal cells. The humanised antibodies are used to evaluate, in animal models, treatments of disease, that involve FasyFas ligand interactions, and also to collupus erythematosus, Hashimoto's disease, graft versus host disease, solarone, solarone, crohn's disease, rheumatoid arthritis, autoimmune haemolytic anaemia, sterility, myasthenia gravis, multiple sclerosis, Basedow's disease, rheumatoid arthritis, myasthenia dravis, myclinder anaemia, habritis, humania, habritis, and transplant rejection (all claimed). As and transplant rejection (all claimed). As and channed and channed and transplant rejection (all claimed).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Š
The wonjugates of antibody fragments - having covalently attached in the conjugates of antibody fragments - having covalently attached in the conjugates of antibody fragments - having covalently polyethylene if glycol, for improving the residence time in the circulation.

Example T; Fig 53; 328pp; English.

Cantibody 664.2.5VILN35A Fab' heavy chain (see W69304) modified to contain a Cys residue in the hinge region, and which contains the complementarity determining regions (CDRs) of murine anti-IL-8 concolonal antibodies Chain (see W69303). Humanised anti-IL-8 monoclonal antibodies (MAbs) and variants are described for use in diagnostic applications CC and in the treatment of inflammatory disorders. The invention CC provides conjugates of an antibody fragment and a non-proteinaceous polymer, such as PEG, that have improved half-life, mean residence time, and/or clearance rate compared to non-derivatised parental CC antibody fragment also claimed is a Rab' or Fab-SH antibody CC amino acids +1-233 of the heavy chain maino acid sequence composed of CC amino acids +1-233 of the heavy chain polypeptide of 664.2.5VIIN35A
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               15-FEB-1999 (first entry)

new conjugates or antibody fragments - naving covalently attached non-proteinaceous or antibody fragments - naving covalently attached placely. For improving the residence time in the circulation. Disclosure; Fig 37: 328pp; English.

This DNA sequence encodes humanised anti-interleukin-8 (IL-8) antibody 664.2. SVININ35A heavy chain (see W65030) in an N-terminal fusion with the STII leader peptide and in a C-terminal fusion with the STII leader peptide and in a C-terminal fusion with the STII leader peptide and the conclains the complementarity determining regions (CDRs) of murine anti-IL-8 monoclonal antibodies (MADS) chain template. Humanised anti-IL-8 monoclonal antibodies (MADS) and in the treatment of inflammatory disorders. The invention provides conjugates of an antibody fragment and a non-proteinaceus of un the treatment of inflammatory disorders. The invention provides conjugates of an antibody fragment and an orderivatised parental antibody fragment. Also claimed are a polypeptide that is an antibody fragment. Also claimed are a polypeptide that is an antibody fragment antibody fragment comprising a light chain amino acid sequence comprising the light chain CDRs of 64.2.5711N35A (see W69301) or 664.2.5711N35A, in which the Cys231 and Cys231 and Cys231 and Cys231 and Sequence of 64.2.5711N35A in which the Cys231 and Cys231 and ulcerative colitis), ischemic reperfusion, adult respiratory distress syndrome, dermatitis, meningitis, encephalitis, userial support of 64.2.5711N35A in which the Cys231 and ulcerative colitis), ischemic reperfusion, and ulcerative colitis, diseases involving leukocyte dispeases; central nervous system inflammatory disorder, multippe organ injury syndrome, vasculitis, diseases involving leukocyte dispeases included cystic fibrosis. They can also be used in diagnostic applications. Syndrome eccondary to septicement and supplemental and some prop
                                                                           Humanised anti-IL-8 6G4.2.5V11N35A heavy chain DNA.

Humanised anti-IL-8 6G4.2.5V11N35A heavy chain DNA.

Humanised anti-IL-8 6G4.2.5V11N35A heavy chain DNA.

PT glycol, for improving the residence time in the circulation.

Example K; Fig 41A-U; 328pp; English.

CC This is the DNA sequence of vector plasmid p6G4V1IN35A.F(ab')2

CC encoding a murine-human chimeric Fab (see W69313) containing

CC (II-8) monoclonal antibody (MAb) 6G5.2.5 (see W69319-10) in a

CC human template. Humanised anti-II-8 MAbs (see W69309-10) in a

CC described for use in diagnostic applications and in the treatment

CC of inflammatory disorders. The invention provides conjugates of an

CC antibody fragment and a polymer, such as PEG, that have improved

CC conjugates can be used for immune therapy of e.g. psoriasis,

CC responses associated with inflammatory bowel disease (such as

CC conn's disease and ulcerative colitis), ischemic reperfusion,

CC adult respiratory distress syndrome, dermatitis, meningitis,

CC arthritis, Sjorgen's syndrome, vasculitis, diseases involving

CC arthritis, Sjorgen's syndrome secondary to septicaemia or trauma,

CC multiple organ injury syndrome secondary to septicaemia or trauma,

CC alcoholic hepatitis, bacterial pneumonia, antigen-antibody complex

CC monochiectasis, and cystic fibrosis.

New antibody 4B5 polynucleotides and polypeptides - used to develop products for the diagnosis and treatment of cancers and for products for the diagnosis and treatment of cancers and for products for the diagnosis and treatment of cancers and for Claim 6; Page 7B; 8B9P; English.

This is the complementary strand of a DNA sequence (see also This is the complementary strand of a DNA sequence (see also This is the complementary strand of a DNA sequence (see also This is the recombinant human monoclonal antibody (MAD) 4B5. 4B5 of the recombinant human monoclonal antibody (MAD) 4B5. 4B5 of the recombinant human monoclonal antibody (MAD) 4B5. 4B5 recognises antibodies specific for GD2 antigen antibodies. Such neuroblastoma, malignant and/or metastatic melanoma, breast colon adenocarcinoma, unique and prostate adenocarcinoma, breast colon adenocarcinoma, breast and prostate adenocarcinoma. The invention encompasses 4B5 derivatives with immunologic specificity for netiodies specific for GD2. These derivatives, or antigen binding fragments, may comprise regions of these 4B5 VD3 function and regions spanning the 4B5 CDRs. Other derivatives include Fab, F(ab/)2, comprising the 4B5 CDRs. Other derivatives include Fab, F(ab/)2, comprising these polynucleotides. 4B5 mincs GD2, and is useful in generating a host immune response to cancer. Products of the treatment of enguarention can be used in the detection and treatment of enguarention can be used in the detection and treatment of enguarention can be used in the detection and treatment of enguarentions. Small and large cell lung adenocarcinoma, small and large cell lung adenocarcinoma, and liver metastases, hepatoma, childing and denocarcinoma, and liver metastases, hepatoma, collangiocarcinoma, small and lobular adenocarcinoma, and liver metastases, hepatoma, collangiocarcinoma, small and large cell lung denocarcinoma, and liver metastases, hepatoma, collangiocarcinoma, and denocarcinoma, and diffuse). Plasmate adenocarcinoma, and diffuse) plasmate adenocarcinoma, and dif
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       1431 ATGGACTGGACCTGGAGGGTCCTCTTGGTGGCAGCAGCTACAAGTGCCCGCTCCCAG 1372

The sequences given in Q35099:100 encode the heavy and light chains of Antibody D respectively. Antibody D is a monoclonal antibody which was derived from peripheral blood lymphocytes from a hepatitis A virus (HAV) sero positive patient. Antibody D is closely related in nature to murine antibody B5B3. Total RNA was solated from antibody Expressing cells and polyadenylated RNA was extracted. These polyA RNA's were used to prepare a cDNA library which was screened for human kappa light (L) chains and two positive clones were detected.

Further heavy (H) chain clones were also isolated.

The sequence shows a vector contg. TCAEB, a gene encoding a chimeric anti-CDO antibody for treatment of B cell lymphomas. TCAEB contains 4 transcriptional cassettes, human Ig 11ght and heavy chain constant regions, dihydrofolate reductase, neomycin phosphotransferase and murine variable regions. The vector can be used to produce antibodies which cause depletion of peripheral blood B cells, including those associated with lymphoma. They mediate complement-dependent lysis and lyse target cells by antibody-dependent cellular
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                2400 AFGGGTFGGAGCCTCATCTTGCTTGTCGCTGTTGCTACGCGTGTCCTGTCCCAG 2459

Traget plasmid Molly containing anti-CD20 gene.

Molly: target plasmid; gene integration; gene amplification;

Chimeric - Mus sp.

Chimeric - Escherichia coli.

Chimeric - Escherichia coli.

Chimeric - Cytomegalovirus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             2997 TCAGGACTCTACTCCCTCAGCAGCGTGGTGCCCTCCAGCAGCTTGGGCACCAG

(IDEC-) IDEC PHARM CORP.  Barnett RS, McLachlan KR, Reff ME; WPI; 98-52129/44.  Site specific integration of DNA in mammals for expressing, e.g. Site specific integration of DNA in mammals for expressing, e.g. immunoglobulins - comprises homologous recombination using selectable marker and target plasmids.  Example 1; Fig 8; 114pp; English.  This is the nucleotide sequence of novel target plasmid Molly. This is the nucleotide sequence of novel target plasmid Molly. The plasmid includes the murine dihydrofolate reductase (DHFR) gene, the Escherichia coli beta-galactosidase gene, baculovirus DNA, a cassette comprising the promoter and enhancer elements from cytomegalovirus and SV40 virus, the E. coli beta-glucuronidase (GUS) gene, firefly luciferase gene, Salmonella typhimurium histidinol dehydrogenase gene (HisD) and transposon Tn5 neomycin	intain the nu crification for scification for sequenom the sequenom crification.	specification. The maintain the nucleo specification for 1 q this base represent from the sequence specification. It maintain the nucleo specification for 1 r this base represent from the sequence cancel finance of the sequence of the seq	a · a ·	

phosphotransferase (neo) gene sequences, in a pBR-derived backbone, and allos an anti-B cell antigen CD20 chimeric antibody C2BB gene.

The invention provides a novel method for integrating a desired exogneous DNA at a target site within the genome of a mammalian cell with a homologous recombination. This involves transfecting the cell with a 'marker plasmid' such as Desmond (see V61792), which contains a unique sequence that is foreign to the mammalian cell genome and which provides a substrate for homologous recombination, to Mandy (see V6174), containing a sequence which provides for or Mandy (see V6174), containing a sequence which provides for composing plasmid, and further comprising a desired DNA that is composited into the mammalian cells, typically an immunoglobulin or other secreted mammalian glycoprotein. The homologous recombination system utilises the neo gene as a dominant selectable marker. The neo gene is split into 3 exons. Exon 3 is present on the marker plasmid and becomes integrated on the marker plasmid and becomes integrated on the marker plasmid and becomes integrated on the marker plasmid and see separated by an intron into which at conto the mammalian cells. Exons 1 and 2 are present on the marker plasmid and are separated by an intron into which at the targeting plasmid, and are separated by an intron into which at the correct splicing of all 3 exons of the neo gene and expression of the targeting vector with the integrated marking vector results of a functional neo protein. The method is applicable to all protein. The use of a triply spliced selectable marker means that all selected colonies arise from homologous recombination. In protein, the number of colonies that need to be screened to identify high producer clones is reduced. An amplifiable gene completed to this site, the gene is further enhanced by gene is targeted to this site, the gene is further enhanced by gene is further enhanced.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Patent No. 5843439

GENERAL INFORMATION:

GENERAL INFORMATION:

APPLICANT: HANNA, Nabil

APPLICANT: NEWMAN, ROLand A.

APPLICANT: REFF, Mitchell E.

APPLICANT: REFF, William H.

TITLE OF INVENTION: THERAPEUTIC APPLICATION OF CHIMERIC AND

TITLE OF INVENTION: THERAPEUTIC APPLICATION ANTIGEN FOR THE TREATMENT OF B CELL

TITLE OF INVENTION: LYMPHOMA

CODEN: JIMMB

RECORD TYPE: Abstract LANGUAGE: ENGLISH

ABSTRACT: By immunizing mice genetically deficient in C5 we were able to obtain a group of monoclonal antibodies to rabbit C5 that cross-react with C5 from a wide variety of mammalian sera, including mouse. The specificity of the monoclonal antibodies was against native C5 and C5b but not C5a. The antibodies strongly inhibit the expression of C5 hemolytic activity. We suggest that these monoclonal antibodies will be useful for studying C5 as well as providing a way to selectively deplete C5 from plasma in vitro or in vivo.
